

Appendix D: Project Prioritization

The Northwest Arkansas region is committed to Vision Zero to eliminate roadway fatalities and serious injuries by 2038. The NWA Vision Zero Plan establishes the goals and actions that need to be taken by the state, regional, and local agencies along with supporting partners to achieve Vision Zero. This report serves to provide direction on project prioritization and safety countermeasure selection for traffic safety projects across Northwest Arkansas. The actions, Prioritization Frameworks, and the proven safety countermeasures in the NWA Vision Zero Plan should be used congruently to guide the implementation of the strategies that specifically relate to roadway safety infrastructure improvements.

The information in this report is a guide for the Region and member agencies to prioritize and implement traffic safety projects using the Safe Systems Approach. The Northwest Arkansas Regional Planning Commission (NWARPC) will be able to use the Project Prioritization Frameworks to further prioritize and implement projects as funding is allocated for safety projects.

This report has two sections. In the first section, the Project Prioritization Framework outlines the criteria for prioritization and select location-specific and systemic safety projects. The second section lists the projects along the high-injury network and the outputs from the Safer Streets Priority Finder model along with their scoring based on these criteria.

Project Prioritization Framework

The Project Prioritization Framework will support the Northwest Arkansas region in the decision-making process to target its Vision Zero strategies and ultimately eliminate roadway fatalities and serious injuries. The Frameworks will allow the region to:

1. identify the locations to focus its limited resources and the projects to prioritize at those priority locations, and
2. prioritize systemic improvements that member agencies can do across their roadway networks to increase safety without needing to do further analysis.

This section outlines the prioritization process for location-specific projects and systematic proactive projects.

Location-Specific Project Prioritization and Monitoring Frameworks

Location-specific project prioritization ranks roadway segments by safety need through a data-driven process. In this framework, five metrics that incorporate roadway crash history, crash severity, community input, and equity are used to prioritize roadway segments. The metrics are weighted to help ensure that projects deployed at the prioritized locations will have the best likelihood to help the region and member agencies achieve Vision Zero. Total scores were developed for each location-specific projects on the HIN. Note that since all of the corridors are on the HIN, the corridors are ranked equally under that metric. Projects were categorized into three project tiers—Tier 1 being the highest priority and Tier 3 being the lowest—with approximately equal number of projects in each tier. Adjustments were made to ensure projects with the same total scores were always in the same tier.

The table below summarizes the five metrics and outlines the weighting for each.

Table 1: Metrics for the Location-Specific Project Prioritization Framework

Metric	Description	Weight	Score Type
Number of Killed or Seriously Injured (KSI) Crashes	The total number of KSI crashes per mile (density) on the roadway segment in the most recent five years of crash data. This is the top-weighted metric to prioritize the goal of Vision Zero—eliminate fatalities and serious injuries on roadways across Northwest Arkansas. Crash data is sourced from both the Arkansas and Missouri Departments of Transportation.	30%	Rank by Tiers 3 – Highest 2 – Middle 1 - Lowest
On the Overall High Injury Network (HIN)	Roadway segments that are on the Overall HIN should be prioritized in the region's overall roadway project prioritization process. While project prioritization would score all projects, using the overall HIN metric ensures safety is paramount in ranking all roadway projects. This metric weights where crashes are occurring at the greatest injury severity and density through a sliding windows analysis.	20%	Part of HIN 3 – Yes 0 - No
Equity and Degrees of Disadvantage	The highest Degree of Disadvantage area that the roadway segment travels through. Equity analysis identifies the areas of the region where a higher proportion of historically disadvantaged people lives along with areas of persistent poverty that can result in social vulnerability.	25%	Rank by Tiers 3 – Highest degree of disadvantage, persistent poverty, and social vulnerability 2 – Some degree of disadvantage, persistent poverty, or social vulnerability 1 - Minimal degree of disadvantage, persistent poverty, or social vulnerability
Total Crashes	The total number of crashes per mile (density) of all severity types that occurred on the roadway segment in the most recent five years of crash data. Crash data is sourced from both the Arkansas and Missouri Departments of Transportation.	10%	Rank by Tiers 3 – Highest tier of total crashes 2 – Middle tier of total crashes 1 – Lowest tier of total crashes
Number of Unsafe Location Comments from Public	The total number of comments received from the public about the roadway segment being unsafe. Road users' perception of safety can help proactively identify unsafe locations that may not have a significant crash history. Data is sourced from the mapping activity conducted as part of the NWA Vision Zero Plan process.	15%	Rank by Tiers 3 – Highest density of comments 2 – Medium density of comments 1 – Lowest density of comments 0 – no comments
		100%	

Once the region and its member agencies have prioritized locations for projects, an additional framework will be used to identify and rank the countermeasures to implement at the priority locations. The Location-Specific Prioritized Project Monitoring Framework will allow the region to move location-specific projects through the process to select countermeasures and tracking of outcomes through these seven steps outlined in the table below. Some projects along the HIN have already been identified by member agencies for safety projects and the countermeasures may have already been identified based on understanding of crashes. This framework should be used to track and evaluate projects consistently and objectively for accountability and flexibility.

Table 2: Steps in the Location-Specific Prioritized Project Monitoring Framework

Step	Description
1 Understanding Crash Causation	<p>Identify individual countermeasures for each of the priority corridors by evaluating the crash causation in the most recent five years of crash data. Evaluate the crash types, contributing factors, and roadway context that may have contributed to crashes, with particular attention to KSI crashes. When evaluating corridors that are on the Overall HIN, identify which of the modal HIN the corridor is on to identify which mode has been most at risk for KSI crashes. As needed, look further into crash causes, by reviewing the full crash reports that occurred on the prioritized corridor.</p> <p>Longer road corridors from the Location-Specific Prioritization Framework can be further segmented. This segmentation can be done for several reasons a.) to match a change in context or configuration of the road (e.g. the road goes from six lanes to four), b.) to select a more management segment length because of limited resources, c.) to match the limits of another corresponding project (e.g. pavement restoration), or d.) to match changes in the prevailing crash risk factors along the corridor.</p>
2 Initial Safety Countermeasures Selection	<p>Conduct a review of the corridor to select safety countermeasures and key design features that would increase traffic safety on the priority corridor. Use the information on crash causation from Step 1 to develop an initial countermeasures list from the proven safety countermeasures and associated toolkit.</p>
3 Final Safety Countermeasures Selection	<p>Fine-tune the countermeasures list from Step 2 based on feasibility, funding, and context. The Crash Modification Factors (CMF)¹ information about each countermeasure (Step 4) should provide insight into the final selection of countermeasures.</p>
4 CMF Modeling	<p>Model CMFs to estimate if the safety countermeasures selected will eliminate KSI crashes. Values for CMFs are used to identify safety countermeasures with the greatest possible safety benefit for a particular location, with the goal of layering multiple safety countermeasures to get a CMF of zero.</p>
5 Design and Engineering	<p>After the set of countermeasures is determined for the location from Steps 3 and 4, begin design and engineering with the goal to provide safe and comfortable places for all road users, especially vulnerable users. Ensure the countermeasures are designed in a layered approach to complement each other and work together to reduce crash severity and eliminate KSI crashes.</p>
6 Construction	<p>Implement the countermeasures. Ensure the construction process follows work zone safety best practices to allow the safe movement of all road users.</p>
7 Safety Outcome Performance	<p>Monitor the safety outcomes and performance of projects by conducting field observations, conducting surveys of road users' perception of safety, and reviewing crash data to determine if desired behaviors changed and if crash frequency and severity are reduced. Perform systemic evaluation across the region and within member agency jurisdictions to see how projects constructed are working toward eliminating KSI crashes by 2038.</p>

¹ USDOT Crash Modification Factors Clearinghouse provides a database of factors that estimates the possible effect countermeasures could have on reducing crashes. <https://www.cmfclearinghouse.org/>

Systemic Proactive Project Prioritization Framework

Systemic treatment implementation is a common Vision Zero approach that identifies many locations for the rapid application of proven safety countermeasures designed to reduce the number of KSI crashes.

Systemic treatments can be proactively implemented throughout the regional and in member agency jurisdictions and are generally considered well-suited for widespread implementation because of their safety effectiveness, cost effectiveness, and feasibility for implementation at multiple locations. These traffic safety infrastructure improvements can usually be made where common safety risk factors exist and often do not require any further analysis implement at specific locations.

The table below lists the safety countermeasures that are recommended for proactive, systemic implementation in Northwest Arkansas. Specific action item language can be found in the action item tables.

Table 3: Systemic Proactive Safety Countermeasures

Countermeasure	Action ID
Pedestrian lighting	1-17
Arterial roadway lighting	1-18
No turns on red	2-1
Pedestrian friendly cycle lengths	2-2
Separation for pedestrians/bicyclists	2-7
Median refuge and pedestrian signals	2-8
Shorter distances between crossings	2-9
Road diets (where applicable)	2-10
Closing slip lanes	2-12
Leading Pedestrian Intervals	2-13
Pedestrian recall	2-14
Countdown pedestrian signal heads	2-15
Removing permissive lefts	2-16
Sidepaths and separated bike lanes	2-17
Edge and centerline rumble strip treatments	2-18
Grade separated pedestrian/bicycle crossings	2-19
Daylight intersections	2-20
Sidewalk buffers	2-22
Access management	2-24
Nighttime speed limits	4-1
Reduce local roadway speed limits to 20mph	4-3
Adjust signal timing for speed management	4-6
Tighter turn radii and truck aprons	4-8

Northwest Arkansas Regional Priority Location-Specific Projects

Location-specific projects across Northwest Arkansas have been identified through the development of the HIN along with using the Safer Streets Priority Finder model to identify a variety of corridors and roadway segments where safety risks could be addressed proactively.

The following tables show the prioritized lists of corridors along the HIN. The maps and tables include all projects in the NWA region along with sorted tables and corresponding maps for projects in the following communities:

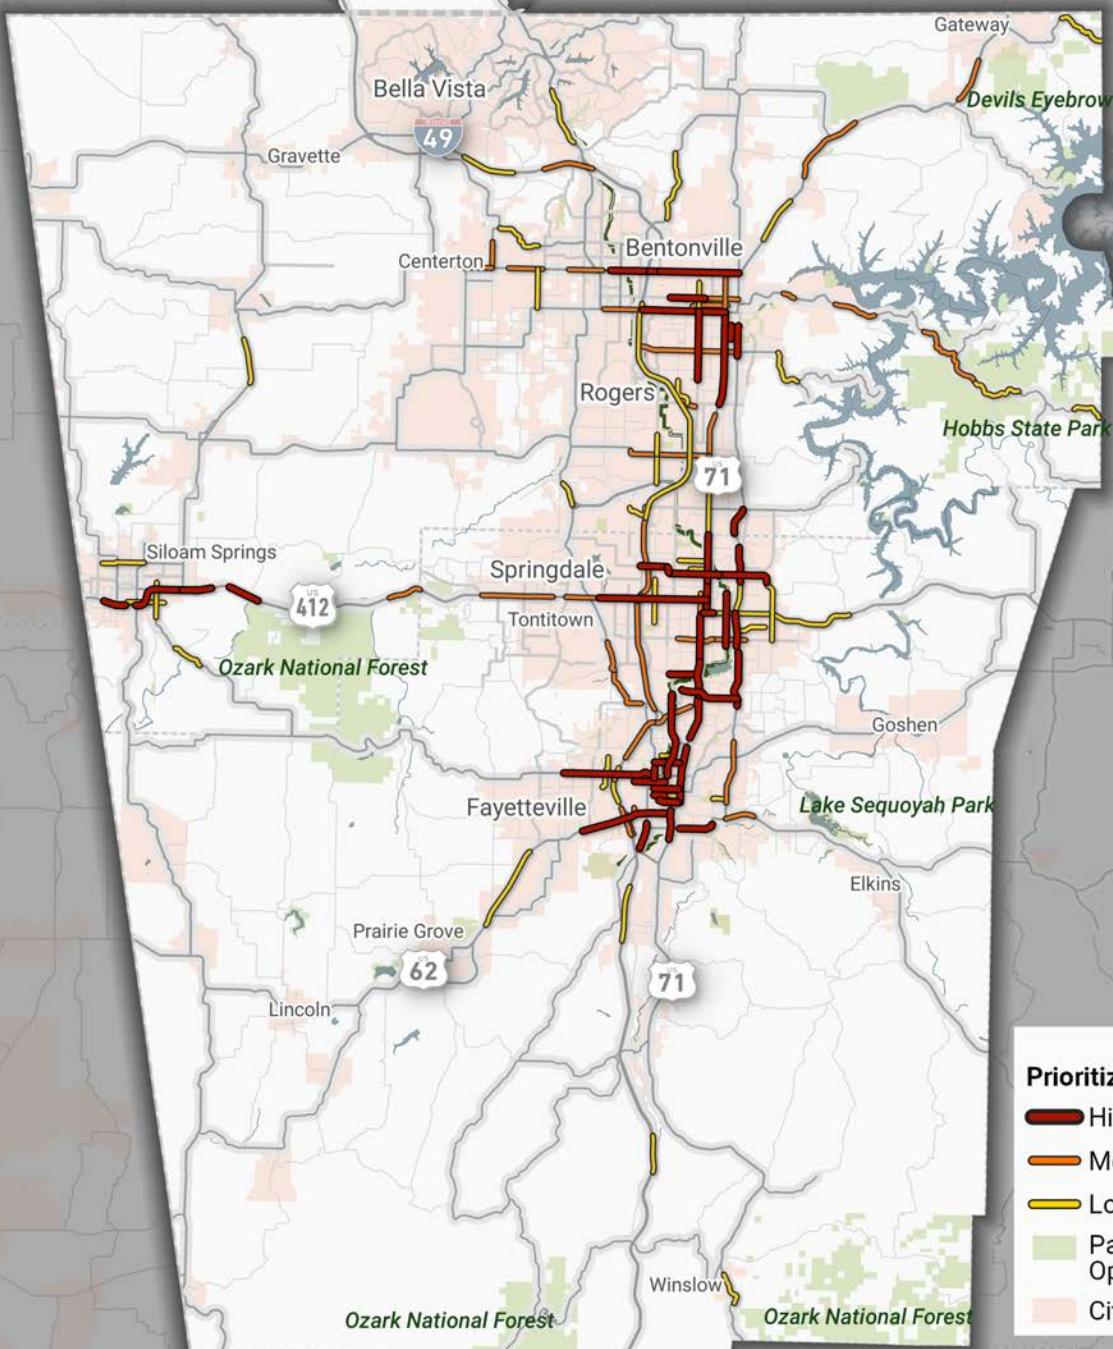

- Bella Vista
- Bentonville
- Centerton
- Fayetteville
- Rogers
- Siloam Springs
- Springdale

Each table lists the following information related to the location-specific project:

1. ID (Tier# - Rank within Tier)
2. Corridor Name
3. To/From Extents
4. Municipality
5. Length (miles)
6. Project Tier
7. Total Score
8. KSI Score
9. KSI Crashes/Mile (Density)
10. All Crash Score
11. All Crashes/Mile (Density)
12. Equity Score
13. HIN Score
14. Public Comment Score
15. HIN Modes
 - p: pedestrian
 - b: bicycle
 - mc: motorcycle
 - mv: motor vehicle
